## Why Incanter?

- charts
- statistics
- data
- graphics
- don't have to use R or MATLAB!

## Getting Started: Your `project.clj`

```
:dependencies [...] [incanter "1.5.6"] ...]
```

## Getting Started: Your Namespace Declaration

```
(ns code.core
  "Howdy Incanter!"
  (:require [incanter.core :as i
             :refer [$ $order $rollup $where conj-cols
                    conj-rows dataset dim save
                    to-dataset view]
             [incanter.datasets :as ids]
             [incanter.stats :as is]
             [incanter.charts :as ic]
             [incanter.io :as iio
             :refer [read-dataset]]))
```

## Sine Waves

The first thing I try to do with any plotting system is a simple sine wave. If a plotting library can't easily do that, it's outclassed by a cheap calculator for junior-high school students.

# Sine Waves

```
(view (ic/function-plot #(Math/sin %) -4 4  
      :y-label "sin(x)"))
```

## Data Sets

You probably want to look at data if you are interested in Incanter. For a really small data set, you might just define it inline.

```
(def small-data (dataset ["x" "y" "theta"]  
                        [[1 2 3]  
                         [4 5 6]  
                         [7 8 9]]))
```

## Data Sets from CSVs

If you are working with a real data set, then it's probably living in a CSV file or a database.

```
(def pass-data (read-dataset "../Pass.csv"
                             :header true))

(def fail-data (read-dataset "../Pass.csv"
                             :header true))
```

## Data Sets from Hash Maps

Clojure *loves* hash maps. How do you make a data set out of them?

```
(def data-from-hashmaps (to-dataset [{:x 1 :y 2}
                                      {:x 3 :y 4}
                                      {:x 5 :y 6}]))
```

## Data Sets from Vectors

```
(def data-from-vecs (to-dataset [[1 2 3]
                                  [4 5 6]
                                  [7 8 9]]))
```

```
(def data-cols (conj-cols [1 4 7]
                           [2 5 8]
                           [3 6 9]))
```

```
(def data-rows (conj-rows [1 2 3]
                           [4 5 6]
                           [7 8 9]))
```

## Data Sets from the Internet

There's no need to download the CSV, if you know the path to it.

```
(def air-passengers
  (read-dataset
    (str "http://vincentarelbundock.github.io"
        "/Rdatasets/csv/datasets/AirPassengers.csv")
    :header true))
```

## Included Sample Data Sets

Incanter has a lot of sample data sets included, mostly borrowed from R. Standard data sets are commonly used if you need to test out an algorithm, or compare it to existing algorithms.

```
(def hec (ids/get-dataset :hair-eye-color))
```

<i>: hair</i>	<i>: eye</i>	<i>: gender</i>	<i>: count</i>
<i>black</i>	<i>brown</i>	<i>male</i>	32
<i>black</i>	<i>blue</i>	<i>male</i>	11
<i>⋮</i>	<i>⋮</i>	<i>⋮</i>	<i>⋮</i>

## Saving Data Sets

Incanter provides an easy way to save your data sets to CSV files for use in other tools.

```
(save some-data "some.csv")
```

## The \$ Operator

The \$ operator is a shortcut to get that column of data out of a dataset.

```
(defn x [dataset]
  ($ :x dataset))

(defn y [dataset]
  ($ :y dataset))

(defn theta [dataset]
  ($ :theta dataset))

(defn mpi [dataset]
  ($ (keyword "Monthly_Personal_Income") dataset))
```

## Multiple Columns with the \$ Operator

To select a few columns:

```
($ ["x" "y"] small-data)
```

To remove one of the columns:

```
($ [:not "theta"] small-data)
```

Both produce:

$$\begin{pmatrix} x & y \\ 1 & 2 \\ 4 & 5 \\ 7 & 8 \end{pmatrix}$$

## Single Rows with the \$ Operator

We can select a few columns:

```
($ ["x" "y"] small-data)
```

$$\begin{pmatrix} x & y \\ 1 & 2 \\ 4 & 5 \\ 7 & 8 \end{pmatrix}$$

And then select a single row, zero-indexed:

```
($ 1 ["x" "y"] small-data) ; Returns '(4 5)
```

## The \$where Operator

`($where {:hair "red"} hec) ; Only with red hair`

<i>: hair</i>	<i>: eye</i>	<i>: gender</i>	<i>: count</i>
<i>red</i>	<i>brown</i>	<i>male</i>	<i>10</i>
<i>red</i>	<i>blue</i>	<i>male</i>	<i>10</i>
<i>red</i>	<i>hazel</i>	<i>male</i>	<i>7</i>
<i>red</i>	<i>green</i>	<i>male</i>	<i>7</i>
<i>red</i>	<i>brown</i>	<i>female</i>	<i>16</i>
<i>red</i>	<i>blue</i>	<i>female</i>	<i>7</i>
<i>red</i>	<i>hazel</i>	<i>female</i>	<i>7</i>
<i>red</i>	<i>green</i>	<i>female</i>	<i>7</i>

## The \$where Operator

```
($where {:count {:lt 5}} hec) ; only small samples
```

<i>: hair</i>	<i>: eye</i>	<i>: gender</i>	<i>: count</i>
<i>black</i>	<i>green</i>	<i>male</i>	<i>3</i>
<i>blond</i>	<i>brown</i>	<i>male</i>	<i>3</i>
<i>black</i>	<i>green</i>	<i>female</i>	<i>2</i>
<i>blond</i>	<i>brown</i>	<i>female</i>	<i>4</i>

## The \$where Operator

```
($where (fn [row] ; We can do any function we want.
  (and (= (row :hair) "blond")
        (= (row :eye) "blue"))))
hec)
```

<i>: hair</i>	<i>: eye</i>	<i>: gender</i>	<i>: count</i>
<i>blond</i>	<i>blue</i>	<i>male</i>	30
<i>blond</i>	<i>blue</i>	<i>female</i>	64

## The \$order Operator

```
($order :count :desc hec)
```

<i>: hair</i>	<i>: eye</i>	<i>: gender</i>	<i>: count</i>
<i>brown</i>	<i>brown</i>	<i>female</i>	<i>66</i>
<i>blond</i>	<i>blue</i>	<i>female</i>	<i>64</i>
<i>brown</i>	<i>brown</i>	<i>male</i>	<i>53</i>
<i>brown</i>	<i>blue</i>	<i>male</i>	<i>50</i>
<i>black</i>	<i>brown</i>	<i>female</i>	<i>36</i>
<i>brown</i>	<i>blue</i>	<i>female</i>	<i>34</i>
<i>black</i>	<i>brown</i>	<i>male</i>	<i>32</i>
<i>blond</i>	<i>blue</i>	<i>male</i>	<i>30</i>
<i>:</i>	<i>:</i>	<i>:</i>	<i>:</i>

## The \$rollup Operator

```
($rollup i/sum :count [:hair :eye] hec)
```

<i>: eye</i>	<i>: hair</i>	<i>: count</i>
<i>hazel</i>	<i>brown</i>	54.0
<i>brown</i>	<i>blond</i>	7.0
<i>green</i>	<i>red</i>	14.0
<i>brown</i>	<i>red</i>	26.0
<i>hazel</i>	<i>red</i>	14.0
<i>blue</i>	<i>red</i>	17.0
<i>blue</i>	<i>blond</i>	94.0
<i>green</i>	<i>black</i>	5.0
<i>⋮</i>	<i>⋮</i>	<i>⋮</i>

## Combining Operators

```
($order :count :desc  
  ($rollup i/sum :count [:hair :eye] hec))
```

<i>: eye</i>	<i>: hair</i>	<i>: count</i>
<i>brown</i>	<i>brown</i>	119.0
<i>blue</i>	<i>blond</i>	94.0
<i>blue</i>	<i>brown</i>	84.0
<i>brown</i>	<i>black</i>	68.0
<i>hazel</i>	<i>brown</i>	54.0
<i>green</i>	<i>brown</i>	29.0
<i>⋮</i>	<i>⋮</i>	<i>⋮</i>

## Statistics

There is a lot of statistics available. Some of the basics:

```
(def mpi-stats {:mean (is/mean mpi-filtered)
                 :variance (is/variance mpi-filtered)
                 :std-dev (is/sd mpi-filtered)
                 :median (is/median mpi-filtered)
                 :kurtosis (is/kurtosis mpi-filtered)})
```

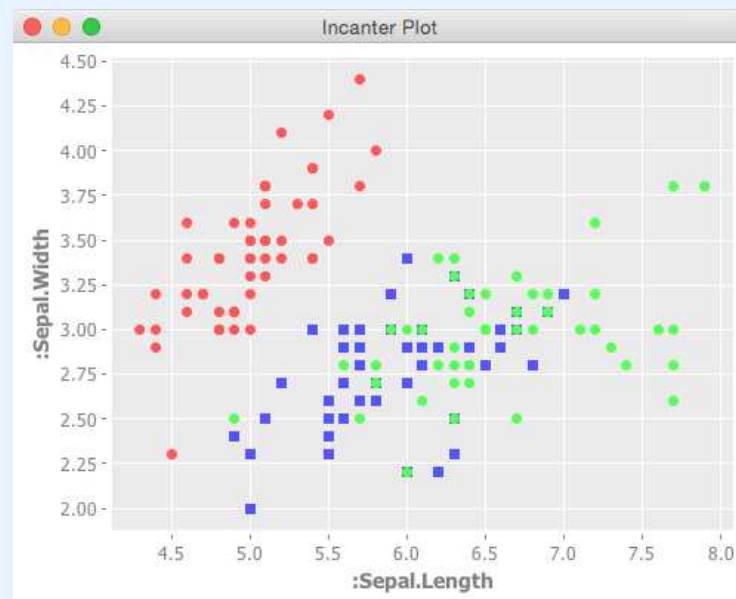

# Histograms

```
(let [mpi-filtered (filter #(< 0 %) (mpi pass-data))  
      mpi-log10 (map #(Math/log10 %) mpi-filtered)]  
  (view (ic/histogram mpi-log10  
    :x-label "Monthly_Personal_Income"  
    :nbins 50)))
```

## Scatter Plots

```
(i/with-data (ids/get-dataset :iris)  
  (view (ic/scatter-plot :Sepal.Length :Sepal.Width  
    :group-by :Species)))
```

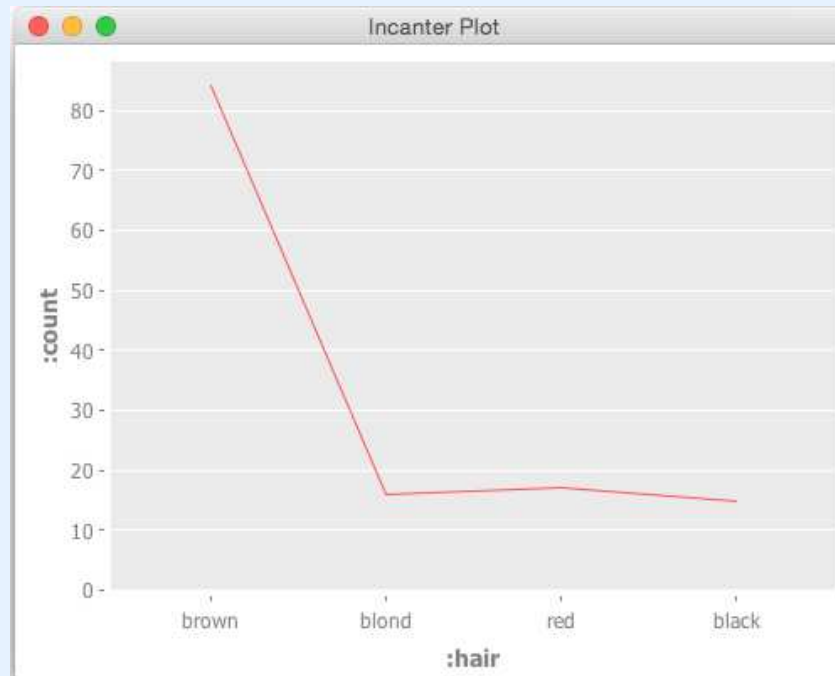

## Bar Charts

```
(i/with-data (ids/get-dataset :co2)
  (view (ic/bar-chart :Type :uptake
    :title "CO2_Uptake"
    :group-by :Treatment
    :x-label "Grass_Types"
    :y-label "Uptake"
    :legend true)))
```

## Line Charts

```
(i/with-data ($rollup i/sum :count [:hair :eye] hec)
  (view (ic/line-chart :hair :count)))
```

**And there's a lot more I didn't mention!**

*Questions?*
